

## Pre-lecture brain teaser

In the following languages, three are decidable and three are undecidable. Which are which?

- $A_{CFG} = \left\{ \langle G, w \rangle \mid G \text{ is a } CFG \text{ that generates string } w \right\}.$
- $E_{CFG} = \left\{ \langle G \rangle \mid G \text{ is a } CFG \text{ and } L(G) = \emptyset \right\}.$
- $ALL_{CFG} = \left\{ \langle G \rangle \mid G \text{ is a } CFG \text{ and } L(G) = \Sigma^* \right\}.$
- $A_{LBA} = \left\{ \langle M, w \rangle \mid M \text{ is a } LBA \text{ that generates string } w \right\}.$
- $E_{LBA} = \left\{ \langle M \rangle \mid M \text{ is a } LBA \text{ where } L(M) = \emptyset \right\}.$
- $ALL_{LBA} = \left\{ \langle M \rangle \mid M \text{ is a } LBA \text{ where } L(M) = \Sigma^* \right\}.$

## Pre-lecture brain teaser

In the following languages, three are decidable and three are undecidable. Which are which?

- $A_{CFG} = \left\{ \langle G, w \rangle \mid G \text{ is a } CFG \text{ that generates string } w \right\}.$
- $E_{CFG} = \left\{ \langle G \rangle \mid G \text{ is a } CFG \text{ and } L(G) = \emptyset \right\}.$
- $ALL_{CFG} = \left\{ \langle G \rangle \mid G \text{ is a } CFG \text{ and } L(G) = \Sigma^* \right\}.$
- $A_{LBA} = \left\{ \langle M, w \rangle \mid M \text{ is a } LBA \text{ that generates string } w \right\}.$
- $E_{LBA} = \left\{ \langle M \rangle \mid M \text{ is a } LBA \text{ where } L(M) = \emptyset \right\}.$
- $ALL_{LBA} = \left\{ \langle M \rangle \mid M \text{ is a } LBA \text{ where } L(M) = \Sigma^* \right\}.$

$A_{CFG}$  decidable?

$A_{CFG}$  decidable?

YES!

## $A_{CFG}$ decidable?

YES!

- $V = \{S\}$
- $T = \{0, 1\}$
- $P = \{S \rightarrow \epsilon \mid 0S0 \mid 1S1\}$   
(abbrev. for  $S \rightarrow \epsilon, S \rightarrow 0S0, S \rightarrow 1S1$ )

## $A_{CFG}$ decidable?

YES!

### **Lemma**

*A CFG in Chomsky normal form can derive a string  $w$  in at most  $2^n$  steps!*

Knowing this, we can just simulate all the possible rule combinations for  $2^n$  steps and see if any of the resulting strings matches  $w$ .

$E_{CFG}$  decidable?

$E_{CFG}$  decidable?

YES!

## $E_{CFG}$ decidable?

YES!

In this case, we just need to know if we can get from the start variable to a string with only terminal symbols.

1. Mark all terminal symbols in  $G$
2. Repeat until no new variables get marked:
  - 2.1 Mark any variable  $A$  where  $G$  has the rule  $A \rightarrow U_1 U_2 \dots U_k$  where  $U_i$  is a marked terminal/variable
3. If start variable is not marked, accept. Otherwise reject.

- $V = \{S\}$
- $T = \{0, 1\}$
- $P = \{S \rightarrow \epsilon \mid 0S0 \mid 1S1\}$   
(abbrev. for  $S \rightarrow \epsilon, S \rightarrow 0S0, S \rightarrow 1S1$ )

$ALL_{CFG}$  decidable?

$ALL_{CFG}$  decidable?

Nope

$ALL_{CFG}$  decidable?

Nope

Proof requires computation histories which are outside the scope of this course.

$A_{LBA}$  decidable?

$A_{LBA}$  decidable?

YES!

## $A_{LBA}$ decidable?

YES!

Remember a LBA has a finite tapes. Therefore we know:

1. A tape of length  $n$  where each cell can contain  $g$  symbols, you have  $g^n$  possible configurations.
2. The tape head can be in one of  $n$  positions and has  $q$  states yielding a tape that can be in  $qn$  configurations.
3. Therefore the machine can be in  $qng^n$  configurations.

## $A_{LBA}$ decidable?

YES!

Remember a **LBA** has a finite tapes. Therefore we know:

1. A tape of length  $n$  where each cell can contain  $g$  symbols, you have  $g^n$  possible configurations.
2. The tape head can be in one of  $n$  positions and has  $q$  states yielding a tape that can be in  $qn$  configurations.
3. Therefore the machine can be in  $qng^n$  configurations.

### Lemma

*If an **LBA** does not accept or reject in  $qng^n$  then it is stuck in a loop forever.*

## $A_{LBA}$ decidable?

Decider for  $A_{LBA}$  will:

1. Simulate  $\langle M \rangle$  on  $w$  for  $qng^n$  steps.
  - 1.1 if accepts, then accept
  - 1.2 if rejects, then reject
2. If neither accepts or rejects, means it's in a loop in which case, reject.

$E_{LBA}$  decidable?

$E_{LBA}$  decidable?

Nope

$E_{LBA}$  decidable?

Nope

Proof requires computational history trick, a story for another time.....

$ALL_{LBA}$  decidable?

$ALL_{LBA}$  decidable?

Nope

$ALL_{LBA}$  decidable?

Nope

No standard proof for this, but let's look at a pattern:

## Decidability across grammar complexities

	<i>DFA</i>	<i>CFG</i>	<i>PDA</i>	<i>LBA</i>	<i>TM</i>
A	D	D	D	D	U
E	D	D	D	U	U
ALL	D	U	U	U	U

Eventually problems get too tough....

## $ALL_{LBA}$ decidable?

Nope

No standard proof for this, but let's look at a pattern:

So we sort've know that  $ALL_{LBA}$  isn't decidable because we knew  $ALL_{CFG}$  wasn't (though intuition is never sufficient evidence).

## Un-/decidability practice problems

---

## Available Undecidable languages

- $L_{Accept} = \left\{ \langle M, w \rangle \mid M \text{ is a } TM \text{ and accepts } w \right\}.$
- $L_{HALT} = \left\{ \langle M \rangle \mid M \text{ is a } TM \text{ and halts on } \varepsilon \right\}.$

## Practice 1: Halt on Input

Is the language:

$$L_{\text{HaltOnInput}} = \left\{ \langle M, w \rangle \mid M \text{ is a } \textcolor{brown}{TM} \text{ and halts on } w \right\}.$$

## Practice 2: L has fooling set

Is the language:

$$L_{HasFooling} = \left\{ \langle M \rangle \mid M \text{ is a } TM \text{ and } L(M) \text{ has a fooling set} \right\}.$$

## NP-Complete practice problems

---

## Practice: NP-Complete Reduction I

A centipede is an undirected graph formed by a path of length  $k$  with two edges (legs) attached to each node on the path as shown in the below figure. Hence, the centipede graph has  $3k$  vertices. The **CENTIPEDE** problem is the following: given an undirected graph  $G = (V, E)$  and an integer  $k$ , does  $G$  contain a centipede of  $3k$  vertices as a subgraph? Prove that **CENTIPEDE** is NP-Complete.

## Practice: NP-Complete Reduction

What do we need to do to prove Centipede is NP-Complete?

## Practice: NP-Complete Reduction

Prove Centipede is in NP:

## Practice: NP-Complete Reduction

Prove Centipede is in NP-hard:

## Practice: NP-Complete Reduction

Prove Centipede is in NP-hard:

**Hamiltonian Path:** Given a graph  $G$  (either directed or undirected), is there a path that visits every vertex exactly once

$HC \leq_P \text{Centipede}$

## Practice: NP-Complete Reduction I

A quasi-satisfying assignment for a 3CNF boolean formula  $\Phi$  is an assignment of truth values to the variables such that at most one clause in  $\Phi$  does not contain a true literal. Prove that it is NP-complete to determine whether a given 3CNF boolean formula has a quasi-satisfying assignment.

## Practice: NP-Complete Reduction I

A quasi-satisfying assignment for a 3CNF boolean formula  $\Phi$  is an assignment of truth values to the variables such that at most one clause in  $\Phi$  does not contain a true literal. Prove that it is NP-complete to determine whether a given 3CNF boolean formula has a quasi-satisfying assignment.

**Prove quasiSAT is in NP**

## Practice: NP-Complete Reduction I

A quasi-satisfying assignment for a 3CNF boolean formula  $\Phi$  is an assignment of truth values to the variables such that at most one clause in  $\Phi$  does not contain a true literal. Prove that it is NP-complete to determine whether a given 3CNF boolean formula has a quasi-satisfying assignment.

**Prove quasiSAT is NP-hard**

## Practice: NP-Complete Reduction II

Prove quasiSAT is NP-hard

## Practice: NP-Complete Reduction II

Prove quasiSAT is NP-hard

**3SAT:** Given a boolean formula in conjunctive normal form, with exactly three distinct literals per clause, does the formula have a satisfying assignment.

Good luck on the exam
