Pre-lecture brain teaser

Find the regular expressions for the following languages (if possible)

1.
$$L_1 = \{0^m 1^n | m, n \ge 0\}$$

2.
$$L_2 = \{0^n 1^n \mid n \ge 0\}$$

3.
$$L_3 = L_1 \cup L_2$$

4.
$$L_4 = L_1 \cap L_2$$

CS/ECE-374: Lecture 5 - Non-regularity and closure

Pre-lecture brain teaser

Find the regular expressions for the following languages (if possible)

1.
$$L_1 = \{0^m 1^n | m, n \ge 0\}$$

2.
$$L_2 = \{0^n 1^n \mid n \ge 0\}$$

3.
$$L_3 = L_1 \cup L_2$$

4.
$$L_4 = L_1 \cap L_2$$

Pre-lecture brain teaser

We have a language $L = \{0^n 1^n | n \ge 0\}$ Prove that L is non-regular.

Proving non-regularity: Methods

- Pumping lemma. We will not cover it but it is *sometimes* an easier proof technique to apply, but not as general as the fooling set technique.
- Closure properties. Use existing non-regular languages and regular languages to prove that some new language is non-regular.
- Fooling sets- Method of distinguishing suffixes. To prove that *L* is non-regular find an infinite fooling set.

Not all languages are regular

Regular Languages, DFAs, NFAs

Theorem Languages accepted by DFAs, NFAs, and regular expressions are the same.

Question: Is every language a regular language? No.

Regular Languages, DFAs, NFAs

Theorem

Languages accepted by DFAs, NFAs, and regular expressions are the same.

Question: Is every language a regular language? No.

- \cdot Each DFA M can be represented as a string over a finite alphabet Σ by appropriate encoding
- · Hence number of regular languages is <u>countably infinite</u>
- · Number of languages is uncountably infinite
- · Hence there must be a non-regular language!

$$L = \{0^n 1^n \mid n \ge 0\} = \{\epsilon, 01, 0011, 000111, \cdots, \}$$

$$L = \{0^n 1^n \mid n \ge 0\} = \{\epsilon, 01, 0011, 000111, \cdots, \}$$

Theorem *L* is not regular.

```
L = \{0^{n}1^{n} \mid n \ge 0\} = \{\epsilon, 01, 0011, 000111, \cdots, \}
```

Theorem L is not regular.

Question: Proof?

$$L = \{0^n 1^n \mid n \ge 0\} = \{\epsilon, 01, 0011, 000111, \cdots, \}$$

Theorem L is not regular.

Question: Proof?

Intuition: Any program to recognize *L* seems to require counting number of zeros in input which cannot be done with fixed memory.

$$L = \{0^n 1^n \mid n \ge 0\} = \{\epsilon, 01, 0011, 000111, \cdots, \}$$

Theorem

L is not regular.

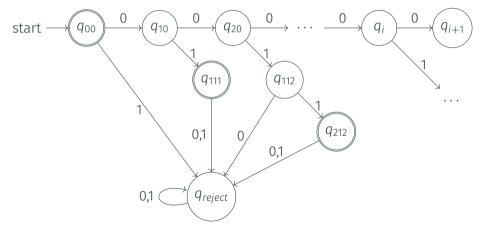

Question: Proof?

Intuition: Any program to recognize *L* seems to require counting number of zeros in input which cannot be done with fixed memory.

How do we formalize intuition and come up with a formal proof?

- Suppose L is regular. Then there is a DFA M such that L(M) = L.
- Let $M = (Q, \{0,1\}, \delta, s, A)$ where |Q| is finite.

- Suppose L is regular. Then there is a DFA M such that L(M) = L.
- Let $M = (Q, \{0,1\}, \delta, s, A)$ where |Q| is finite.

- Suppose L is regular. Then there is a DFA M such that L(M) = L.
- Let $M = (Q, \{0, 1\}, \delta, s, A)$ where |Q| = n.

- Suppose L is regular. Then there is a DFA M such that L(M) = L.
- Let $M = (Q, \{0, 1\}, \delta, s, A)$ where |Q| = n.

Consider strings ϵ , 0, 00, 000, \cdots , 0ⁿ total of n + 1 strings.

- Suppose L is regular. Then there is a DFA M such that L(M) = L.
- Let $M = (Q, \{0, 1\}, \delta, s, A)$ where |Q| = n.

Consider strings ϵ , 0, 00, 000, \cdots , 0ⁿ total of n+1 strings.

What states does M reach on the above strings? Let $q_i = \delta^*(s, 0^i)$.

By pigeon hole principle $q_i = q_j$ for some $0 \le i < j \le n$. That is, M is in the same state after reading 0^i and 0^j where $i \ne j$.

- Suppose L is regular. Then there is a DFA M such that L(M) = L.
- Let $M = (Q, \{0, 1\}, \delta, s, A)$ where |Q| = n.

Consider strings ϵ , 0, 00, 000, \cdots , 0ⁿ total of n + 1 strings.

What states does M reach on the above strings? Let $q_i = \delta^*(s, 0^i)$.

By pigeon hole principle $q_i = q_j$ for some $0 \le i < j \le n$. That is, M is in the same state after reading 0^i and 0^j where $i \ne j$.

M should accept $0^i 1^i$ but then it will also accept $0^j 1^i$ where $i \neq j$.

- Suppose L is regular. Then there is a DFA M such that L(M) = L.
- Let $M = (Q, \{0, 1\}, \delta, s, A)$ where |Q| = n.

Consider strings ϵ , 0, 00, 000, \cdots , 0ⁿ total of n + 1 strings.

What states does M reach on the above strings? Let $q_i = \delta^*(s, 0^i)$.

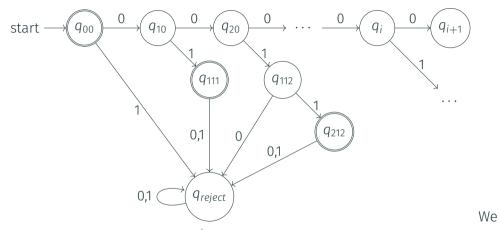

By pigeon hole principle $q_i = q_j$ for some $0 \le i < j \le n$. That is, M is in the same state after reading 0^i and 0^j where $i \ne j$.

M should accept $0^i 1^i$ but then it will also accept $0^j 1^i$ where $i \neq j$.

This contradicts the fact that M accepts L. Thus, there is no DFA for L.

When two states are equivalent?

States that cannot be combined?

concluded that because each 0^i prefix has a unique state.

Are there states that aren't unique?

Can states be combined?

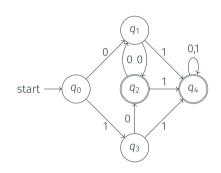

Equivalence between states

Definition $M = (Q, \Sigma, \delta, s, A)$: DFA.

Two states $p, q \in Q$ are equivalent if for all strings $w \in \Sigma^*$, we have that

$$\delta^*(p, w) \in A \iff \delta^*(q, w) \in A.$$

One can merge any two states that are equivalent into a single state.

Distinguishing between states

Definition

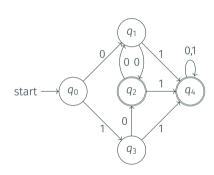

$$M = (Q, \Sigma, \delta, s, A)$$
: DFA.

Two states $p, q \in Q$ are distinguishable if there exists a string $w \in \Sigma^*$, such that

$$\delta^*(p, w) \in A$$
 and $\delta^*(q, w) \notin A$.

or

$$\delta^*(p, w) \notin A$$
 and $\delta^*(q, w) \in A$.

Distinguishable prefixes

$$M = (Q, \Sigma, \delta, s, A)$$
: DFA

Idea: Every string $w \in \Sigma^*$ defines a state $\nabla w = \delta^*(s, w)$.

Distinguishable prefixes

 $M = (Q, \Sigma, \delta, s, A)$: DFA

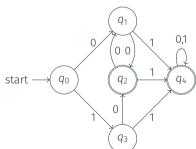

Idea: Every string $w \in \Sigma^*$ defines a state $\nabla w = \delta^*(s, w)$.

Definition

Two strings $u, w \in \Sigma^*$ are distinguishable for M (or L(M)) if ∇u and ∇w are distinguishable.

Definition (Direct restatement)

Two prefixes $u, w \in \Sigma^*$ are distinguishable for a language L if there exists a string x, such that $ux \in L$ and $wx \notin L$ (or $ux \notin L$ and $wx \in L$).

Distinguishable means different states

Lemma

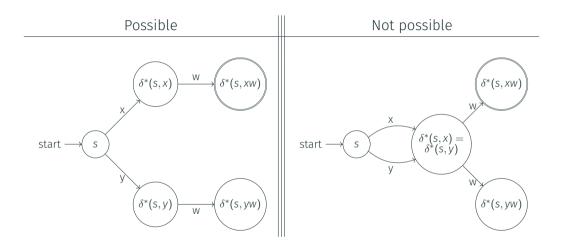

L: regular language.

$$M = (Q, \Sigma, \delta, s, A)$$
: DFA for L.

If
$$x, y \in \Sigma^*$$
 are distinguishable, then $\nabla x \neq \nabla y$.

Reminder:
$$\nabla x = \delta^*(s, x) \in Q$$
 and $\nabla y = \delta^*(s, y) \in Q$

Proof by a figure

Review questions...

• Are $\nabla 0^{j}$ and $\nabla 0^{j}$ are distinguishable for the language $\{0^{n}1^{n} \mid n \geq 0\}$.

Review questions...

- Are $\nabla 0^i$ and $\nabla 0^j$ are distinguishable for the language $\{0^n1^n \mid n \geq 0\}$.
- Let L be a regular language, and let w_1, \ldots, w_k be strings that are all pairwise distinguishable for L. How many states must the DFA for L have?

Review questions...

- Are $\nabla 0^i$ and $\nabla 0^j$ are distinguishable for the language $\{0^n1^n \mid n \geq 0\}$.
- Let L be a regular language, and let w_1, \ldots, w_k be strings that are all pairwise distinguishable for L. How many states must the DFA for L have?
- Prove that $\{0^n1^n \mid n \ge 0\}$ is not regular.

Fooling sets: Proving non-regularity

Fooling Sets

Definition

For a language L over Σ a set of strings F (could be infinite) is a fooling set or distinguishing set for L if every two distinct strings $x, y \in F$ are distinguishable.

Fooling Sets

Definition

For a language L over Σ a set of strings F (could be infinite) is a fooling set or distinguishing set for L if every two distinct strings $x, y \in F$ are distinguishable.

Example: $F = \{0^i \mid i \ge 0\}$ is a fooling set for the language $L = \{0^n 1^n \mid n \ge 0\}$.

Fooling Sets

Definition

For a language L over Σ a set of strings F (could be infinite) is a fooling set or distinguishing set for L if every two distinct strings $x, y \in F$ are distinguishable.

Example: $F = \{0^i \mid i \ge 0\}$ is a fooling set for the language $L = \{0^n 1^n \mid n \ge 0\}$.

Theorem

Suppose F is a fooling set for L. If F is finite then there is no DFA M that accepts L with less than |F| states.

Recall

Already proved the following lemma:

Lemma

L: regular language.

 $M = (Q, \Sigma, \delta, s, A)$: DFA for L.

If $x, y \in \Sigma^*$ are distinguishable, then $\nabla x \neq \nabla y$.

Reminder: $\nabla x = \delta^*(s, x)$.

Proof of theorem

Theorem (Reworded.)

L: A language

F: a fooling set for L.

If F is finite then any DFA M that accepts L has at least |F| states.

Proof.

Let $F = \{w_1, w_2, \dots, w_m\}$ be the fooling set.

Let $M = (Q, \Sigma, \delta, s, A)$ be any DFA that accepts L.

Let $q_i = \nabla w_i = \delta^*(s, x_i)$.

By lemma $q_i \neq q_j$ for all $i \neq j$.

As such, $|Q| \ge |\{q_1, \dots, q_m\}| = |\{w_1, \dots, w_m\}| = |A|$.

Infinite Fooling Sets

Corollary

If L has an infinite fooling set F then L is not regular.

Proof.

Let $w_1, w_2, \ldots \subseteq F$ be an infinite sequence of strings such that every pair of them are distinguishable.

Assume for contradiction that $\exists M$ a DFA for L.

Infinite Fooling Sets

Corollary

If L has an infinite fooling set F then L is not regular.

Proof.

Let $w_1, w_2, \ldots \subseteq F$ be an infinite sequence of strings such that every pair of them are distinguishable.

Assume for contradiction that $\exists M$ a DFA for L.

Let
$$F_i = \{w_1, ..., w_i\}.$$

By theorem, # states of $M \ge |F_i| = i$, for all i.

As such, number of states in M is infinite.

Infinite Fooling Sets

Corollary

If L has an infinite fooling set F then L is not regular.

Proof.

Let $w_1, w_2, \ldots \subseteq F$ be an infinite sequence of strings such that every pair of them are distinguishable.

Assume for contradiction that $\exists M$ a DFA for L.

Let
$$F_i = \{w_1, ..., w_i\}.$$

By theorem, # states of $M \ge |F_i| = i$, for all i.

As such, number of states in M is infinite.

Contradiction: DFA = deterministic finite automata. But M not finite.

• $\{0^n1^n \mid n \ge 0\}$

• $\{0^n1^n \mid n \ge 0\}$

- {bitstrings with equal number of 0s and 1s}

•
$$\{0^n1^n \mid n \ge 0\}$$

• {bitstrings with equal number of 0s and 1s}

$$\cdot \ \{0^k 1^\ell \mid k \neq \ell\}$$

 $L = \{ \text{strings of properly matched open and closing parentheses} \}$

 $L = \{ \mathrm{palindromes} \ \mathrm{over} \ \mathrm{the} \ \mathrm{binary} \ \mathrm{alphabet} \Sigma = \{0,1\} \}$

A palindrome is a string that is equal to its reversal, e.g. 10001 or 0110.

Closure properties: Proving

non-regularity

 $H = \{ bitstrings with equal number of 0s and 1s \}$

$$H' = \{0^k 1^k \mid k \ge 0\}$$

Suppose we have already shown that L' is non-regular. Can we show that L is non-regular without using the fooling set argument from scratch?

 $H = \{ bitstrings with equal number of 0s and 1s \}$

$$H' = \{0^k 1^k \mid k \ge 0\}$$

Suppose we have already shown that L' is non-regular. Can we show that L is non-regular without using the fooling set argument from scratch?

$$H'=H\cap L(0^*1^*)$$

Claim: The above and the fact that L' is non-regular implies L is non-regular. Why?

 $H = \{ bitstrings with equal number of 0s and 1s \}$

$$H' = \{0^k 1^k \mid k \ge 0\}$$

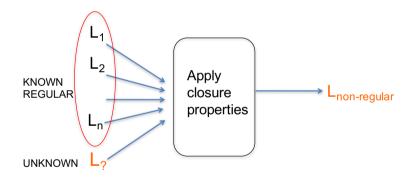

Suppose we have already shown that L' is non-regular. Can we show that L is non-regular without using the fooling set argument from scratch?

$$H'=H\cap L(0^*1^*)$$

Claim: The above and the fact that L' is non-regular implies L is non-regular. Why?

Suppose H is regular. Then since L(0*1*) is regular, and regular languages are closed under intersection, H' also would be regular. But we know H' is not regular, a contradiction.

General recipe:

$$L = \{0^k 1^k \mid k \ge 1\}$$

Careful with closure!

$$L' = \{0^k 1^k \mid k \ge 0\}$$

Complement of L (\overline{L}) is also not regular.

But $L \cup \overline{L} = (0+1)^*$ which is regular.

In general, always use closure in forward direction, (i.e L and L' are regular, therefore L OP L' is regular.)

In particular, regular languages are not closed under subset/superset relations.

Proving non-regularity: Summary

- Method of distinguishing suffixes. To prove that L is non-regular find an infinite fooling set.
- Closure properties. Use existing non-regular languages and regular languages to prove that some new language is non-regular.
- Pumping lemma. We did not cover it but it is sometimes an easier proof technique to apply, but not as general as the fooling set technique.
